

Product Requirements Document

Project Name

Role-Based Field Sales Operations Platform

Purpose

Enable field sales teams to manage territory workflows, record doorstep visits and sales, monitor real-time revenue, and support role-based access for managers, representatives, and admins.

Problem Statement

Field sales teams need a simple, mobile-friendly system to claim and work territories, log house visits and customer interactions, record sales transactions at the door, view territory progress and real-time revenue, and enforce role-based permissions for reps, managers, and admins.

Target Users

1. Representative - Claims territories, visits houses, logs sales, views active territory progress.
2. Manager - Creates and assigns territories, adds houses, monitors team coverage and completed blocks, reviews live sales feed.
3. Admin - Oversees all data, sees total revenue and territory overview, manages users and system access.

Goals

- Deliver a role-based workflow for sales territory operations.
- Ensure accurate territory and house completion metrics.
- Provide live sales visibility and ranking.
- Reduce duplicate territory/house entries.
- Use INR currency formatting consistently.

Key Features

Representative Features:

- Claim available territory
- View assigned territory house grid
- Mark house status: visited, sold, not interested, no answer
- Log sales with product, quantity, payment method
- See territory completion panel and visited/total counts
- Add new house addresses to existing active territory

Manager Features:

- Create new territories with multiple house addresses
- Add houses to existing territories

- View territory assignment grid and progress bars
- Release/unclaim territories
- Track available vs completed territories

Admin Features:

- View total sales and revenue metrics
- See territory overview across the whole system
- Access leaderboard and dashboard summary

Shared Features:

- Dashboard with role-specific widgets
- Live sales stream / recent activity
- Leaderboard sorted by rep revenue
- Role-based routing and permissions
- Duplicate detection for territory names and addresses

Functional Requirements

Dashboard:

- Representative summary: houses visited today, territories visited, total houses visited, today revenue, territory completion, rank.
- Manager summary: live sales feed, team revenue, available territories, completed territories, territory coverage.
- Admin summary: total sales, total revenue, territories managed, active reps, territory overview.

Territories:

- Territory model includes houses with status and lastVisit.
- Create territory endpoint validates unique name and unique house addresses.
- Add houses endpoint rejects duplicates and preserves existing list.
- House update endpoint updates status and lastVisit.
- Territory status updates to completed when all houses are visited.

Sales:

- Log sale endpoint records payment method, customer, house address, products, and total.
- Sale should update corresponding territory house status to sold.

Non-functional Requirements

- Responsive UI for desktop and mobile.
- Secure JWT-based authentication.
- Role-based middleware enforcement.

- Consistent INR formatting across frontend.
- Backend validation for duplicates and required fields.
- Stable API error messaging.

Success Metrics

- Representatives can claim territory and log visits without errors.
- Territory progress count shows distinct territory visited vs houses visited.
- Manager can create territory with multiple houses and avoid duplicates.
- Live sales stream updates accurately.
- Leaderboard displays revenue in INR.
- No duplicate territory or house address insertion.

Constraints & Assumptions

- MongoDB/Mongoose backend.
- React + Vite frontend.
- JWT auth already implemented.
- No real websocket live updates yet; dashboard uses polling/API refresh.
- Territory assignment is single rep per territory.

Future Improvements

- Real-time websocket sales/territory update feed.
- Manager ability to assign reps directly.
- Offline mode for reps on the road.
- More detailed customer / product analytics.
- Territory map visualization.
